

RightFax Shared Services Architecture RightFax 10.6 Collective

NLB

Client connections to the RightFax Application Collective nodes to be handled by network load balancer such as F5.
(Clients connect to vRightFax hostname)

- Suggestions:
1. Create Network Load Balanced Hostname for the Collective Nodes (Requires NLB)
 2. SQL connections from the Collective nodes should point to the SQL server or Cluster Hostname of the SQL server
 3. Shared Storage provided from a fileserver attached to SAN and/or CIFS Share coming off a NAS
 4. All nodes will need access to the Central MSMQ Server

Shared Files Locations

- \\fileservname\rightfax\bft
- \\fileservname\rightfax\cmddata
- \\fileservname\rightfax\image
- \\fileservname\rightfax\outgoing
- \\fileservname\rightfax\papers
- \\fileservname\rightfax\sig

Can be Encrypted with the optional Encryption Module
